

Information

- Goal: working as a group to make a project
- Project deliverables: report (using latex) + code + presentation
- Every week 1h30: meeting for discussing project progress, issues, etc.
- Teams composition: $4 \leq \text{students/team} \leq 5$
- Each team:
 - one project manager: organization of the work and project/meetings planning. This person will be in charge of presenting each week, during the session, the advance of the project.
 - one person in charge of the report. The report has to be done using Latex on Overleaf such that I can have an access.
 - one person in charge of opening and maintaining a repository for the code (github for instance, but might be another repository, but I need to have an access).
 - all team members will participate in writing the final report and presenting its role and work within the project (at the end).

Subject: Interactions of characters in novels

Presentation

- Goal: obtain the list of characters interactions within a novel.
- Result: a text file in which every line is composed of a n-uplet: (timestamp, character1, character2, character3, etc.)
- Choose a novel for which you have the whole text, might be an english, french, polish or whatever language.
- Find a method for extracting the persons from the novel.
- When it is done, extract the moments (line number for instance) when the character is mentioned in the novel.
- When it is done, try to extract the moments when two or more characters are interacting with each other (discussion, game, etc.)
- You can use any IA tools you want.

Subject: Interactions of characters in novels

Constraint

- The choice of the coding language is free.
- You can use any IA tools if you think this could help.
- Whatever the selected method, every step has to be carefully described with the relevant references and pointers to libraries, etc.
- I should have access to the code (open a github repository for instance)
- The report has to be written in Latex using Overleaf.
